Overview

Do building-tied generators provide emergency backup power?

Customers with critical backup power requirements have historically relied on building-tied generators with short-term fuel stockpiles to provide emergency backup power during a grid outage.

Why do supermarkets use backup generators?

The backup generators can then be operated to drop the supermarket's load on the grid during system capacity emergencies in exchange for payment. Payment levels vary by time of year and time of day are proportional to load that can be guaranteed to be removed from the system.

Why should you install a backup generator onsite?

In all these cases, loss of power would come at a significant cost. That's why many Singaporean businesses choose to install a backup generator onsite so that operations can continue as usual, even if a power outage does occur.

Do hybrid backup power systems rely on Distributed Energy Resources?

The analysis presented here does not take into account the impact of hybrid backup power systems that combine emergency diesel generators with other distributed energy resources or variable load on backup systems which allow networked distributed energy resources.

How many backup generators can be used for a building?

Two individual backup generators can also be utilized for buildings with high priority building loads. This configuration offers a backup to the backup and provides a higher degree of reliability. Building-tied emergency diesel generators (EDGs) typically range in size from 10 kW to a few hundred kW.

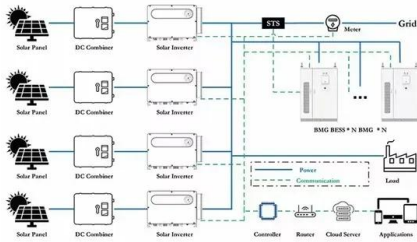

Should you install a backup generator?

Customers considering installing a backup generator should look at both diesel and natural gas as potential fuel sources and consider the potential economic benefits of running the generator for more than just backup. In ERCOT, electric utility consumers procure electricity from a retail electric provider (REP).
