

Increasing the flexibility of new energy storage

Overview

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Can energy storage improve power system flexibility?

The PV penetration level of this system is close to 24 %. The proposed method was demonstrated to be advantageous for power generation, peak power support, and reducing line losses. In terms of utilizing energy storage to enhance power system flexibility, there have been several research studies conducted.

How can we enhance the flexibility of renewable-penetrated power systems?

This paper proposes to enhance the flexibility of renewable-penetrated power systems by coordinating energy storage deployment and deep peak regulation of existing thermal generators. First, the growing flexibility requirement in the presence of variable renewable energy is discussed and quantified using proposed indices.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Why are energy storage technologies important?

Energy storage technologies have been recognized as an important component of future power systems due to their capacity for enhancing the electricity grid's flexibility, reliability, and efficiency. They are accepted as a key answer to numerous challenges facing power markets, including decarbonization, price volatility, and supply security.

How can energy storage help a power system?

While the output power of VERs is accompanied with variability, energy storage can assist the power system to absorb the surplus generation of VERs in the case of over-generation or discharge of their energy to the system to help with any case of production scarcity.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.
