

Installing photovoltaic panels in a wasteland

Overview

Cartosat-2 DEM data is used to create a solar radiation layer that shows the total quantity of incoming solar radiation over the course of a year in kWh/m². The DEM is also used to create slope and azimuth (aspect) layers. Wastelands map is prepared by visual interpretation method to delineate the different type of.

A multi-criteria decision analysis model is developed to select the optimum sites for utilization of available wastelands by taking other socio-economic layer rankings. It is important to give weightage to each of the participating.

For the installation of solar power plants five layers were prepared and standardized i.e., slope, aspect, transmission line, road network, and solar radiation. The pairwise.

For the suitable region identification, it involves the overlying of different GIS data. To find out the suitable region for the installation of solar power.
