Solar thermal encapsulates any technology that takes sunlight and converts it into heat.

How does solar thermal work?

Instead of converting sunlight directly into electricity, as photovoltaics does, solar thermal harnesses the sun's energy to heat a fluid called a heat carrier and then uses that heat to generate electricity or provide heat for industrial or domestic applications.

How is solar thermal energy obtained?

Solar thermal energy is obtained by converting solar heat into useful energy. This is achieved through various technologies. Parabolic solar collectors use curved reflective mirrors to concentrate sunlight onto a receiver containing a thermal fluid. The heat generated is used to produce steam and generate electricity.

Why is solar thermal power important?

Solar thermal power is important for our renewable energy solutions, using the endless sunlight our Earth gets every day. It all starts when solar thermal systems catch the sun's energy using reflective materials. These are often parabolic mirrors or flat plate collectors, engineered to concentrate sunlight onto a specific point or area.
