

Large scale hydrogen energy storage in salt caverns

Overview

Large-scale energy storage is already used to meet energy demand fluctuations in electricity.

The concept of storing gas underground in geological formations arose from the need to supply gas to consumers during periods of high seasonal demand. In many regions worldwide suitable.

The energy demand of Turkey is growing and Turkey's natural gas consumption has been gradually rising since 1986 and reached 39×10^9 m³ in 2010 [20], [37]. Turkey's domestic.

The main favourable characteristics of the Tuz Golu gas storage site for a solar-hydrogen-natural gas based energy system are; large-scale gas storage options, high global irradiation.

Hydrogen will play an important role for the energy industry with the transition from fossil fuels to renewable energy sources due to the need to store extremely large quantities of energy.

Depending on their depth, salt caverns may be operated at pressures up to 200 bars and allowing for large-volume hydrogen storage (from 9 to 6,000 tons). Safety: Due to their tightness, salt caverns allow for safe storage of large quantities of hydrogen under pressure. How much hydrogen is stored in a salt cavern?

Using the same energy storage scale, the volume required for hydrogen storage in salt caverns is 2.77 times that for natural gas. In addition, the peak-shaving of hydrogen storage in salt caverns is rated higher, which is estimated to be 6 ~ 12 times per year, while the average gas storage is twice per year.

How can large-scale energy storage be implemented in salt caverns?

Compressed air and hydrogen storage are two main available large-scale energy storage technologies, which are both successfully implemented in salt caverns. Therefore, large-scale energy storage in salt caverns will also be enormously developed to deal with the intermittent and fluctuations of renewable sources at the national or grid-scale.

What is the energy scale of hydrogen storage in salt caverns?

The energy scale of hydrogen storage in salt caverns is much larger than that of gas storage in salt caverns. Meanwhile, the volume energy density of hydrogen is only 36% of that of natural gas under the same pressure. Using the same energy storage scale, the volume required for hydrogen storage in salt caverns is 2.77 times that for natural gas.

Can salt caverns be used for energy storage?

Salt caverns used for natural gas can also be suitable for underground compressed air and hydrogen gas energy storage purposes. The methods of compressed air and hydrogen gas storage in underground salt caverns are promising candidates for large-scale energy storage applications , , , , .

Can solar-hydrogen and natural gas be used in salt caverns?

In this paper, large quantities underground gas storage methods and design aspects of salt caverns are investigated. A pre-evaluation is made for a salt cavern gas storage field in Turkey. It is concluded that a system of solar-hydrogen and natural gas can be utilised to meet future large-scale energy storage requirements.

Are underground salt caverns suitable for compressed hydrogen gas storage?

In salt caverns, the surrounding rock salt does not react with hydrogen and the intact rock salt is very gastight , . Therefore, underground salt caverns are evaluated as very favourable storage mediums for compressed hydrogen gas storage facilities. 3. Evaluation of Tuz Golu gas storage site
