Overview

The compound Co(bdp) was synthesized using a strategy adopted from a previous report¹⁷. Specifically, a 500-ml solvent bomb was charged with a magnetic stirring bar, Co(CF₃SO₃).

In a glovebox under a N₂ atmosphere, H₂bdp (0.200 g, 0.95 mmol) in DMF (9 ml) was heated to 120 °C while stirring for 20 min in a 20 ml glass vial. The resultant yellow suspensio.

Gas adsorption isotherms for pressures in the range of 0–1.1 bar were measured using a Micromeritics ASAP 2020 or 2420 instrument. Activated samples were transferred unde.

High-pressure CH₄ adsorption isotherms in the range of 0–70 bar were measured on an HPVA-II-100 from Particulate Systems, a Micromeritics company. In a typical measurement, 0.
