

# Microgrid control system function diagram

## Overview

---

What are the components of microgrid control?

The microgrid control consists of: (a) micro source and load controllers, (b) microgrid system central controller, and (c) distribution management system. The function of microgrid control is of three sections: (a) the upstream network interface, (b) microgrid control, and (c) protection, local control.

What is the nature of microgrid?

The nature of microgrid is random and intermittent compared to regular grid. Different microgrid structures with their comparative analyses are illustrated here. Different control schemes, basic control schemes like the centralized, decentralized, and distributed control, and multilevel control schemes like the hierarchal control are discussed.

What is networked controlled microgrid?

Networked controlled microgrid . This strategy is proposed for power electronically based MG's. The primary and secondary controls are implemented in DG unit. The primary control which is generally droop control is already discussed in Section 7. The secondary control has frequency, voltage and reactive power controls in a distributed manner.

How can microgrids be integrated with traditional grids?

In order to achieve optimal grid performance and integration between the traditional grid with microgrids systems, the implementation of control techniques is required . Control methods of microgrids are commonly based on hierarchical control composed by three layers: primary, secondary and tertiary control.

What is a microgrid control system?

Without the inertia associated with electrical machines, a power system frequency can change instantaneously, thus tripping off power sources and

loads and causing a blackout. Microgrid control systems (MGCSs) are used to address these fundamental problems. The primary role of an MGCS is to improve grid resiliency.

What is power flow from microgrid to main grid?

When a condition of insufficient power from microgrid arises, main grid supplies power to microgrid. In case of surplus power availability from microgrid, a control provision for power flow from microgrid to main grid is required. All these controls are provided through central control unit.
