## Overview

How to develop a microgrid to power loads?

Evaluating existing on-site generation options (e.g., on-site PV, energy storage, cogeneration, and back-up generators) is the first step in developing a strategy for the microgrid to power loads. Using existing generation sources is generally preferred over building new generation assets, as it is usually more cost-effective and faster to develop.

Can a microgrid supply enough power?

A microgrid must be able to supply enough generation to match electrical load requirements at all times. Evaluating existing on-site generation options (e.g., on-site PV, energy storage, cogeneration, and back-up generators) is the first step in developing a strategy for the microgrid to power loads.

How are microgrids transforming the energy industry?

Microgrids are revolutionizing the energy industry by combining renewable energy sources, battery storage and backup generator sets. Every microgrid is unique. Solar panels, wind turbines, battery banks, diesel gensets and CHP modules - whether operating separately or in parallel - can all be included in these sophisticated and flexible systems.

What is a microgrid & how does it work?

A microgrid is a flexible and localized power generation system that combines multiple assets. While each system is unique, they all share common elements. A microgrid utilizes renewable energy sources such as solar panels, wind turbines, battery storage, diesel gensets and combined heat and power (CHP) modules—operating separately or in parallel.

How do you calculate power requirements for a microgrid?

The best way to estimate the future power requirements of the microgrid is to analyze or record data for the specific loads and introduce a contingency

above the peak load.<sup>15</sup> Other key considerations for understanding loads include power factor and system harmonics caused by nonlinear loads. See Appendix B for details on these considerations.

What is a microgrid supervisory control system?

A microgrid supervisory control system and generation resources can be used to monitor peak demand at the installation and utilize the microgrid generation to reduce peak demand. Many locations have markets for energy or the services that energy generation could provide.
