

# Microgrid in the substation

## Overview

---

What is a microgrid system?

A microgrid system is a low/medium voltage power network that hosts distributed and renewable energy sources, storage devices, and loads, with a view to best utilise renewable energy resources and reduce dependency on fossil fuel-based energy sources to ensure reduction in greenhouse gas (GHG) emission.

What is a microgrid power supply?

It refers to the fraction of highest generation capacity of all the generating sources in the microgrid. It is mainly used to pump the power to the system whenever there occurs a power shortage because of the sudden change in the load demand or intermittency in the energy generation from the renewable sources.

What can a microgrid power?

A microgrid can also power just a key portion of its area, such as emergency services and government facilities. For most of its history, the electric grid has relied mainly on large, central power stations, using resources like coal, hydropower and nuclear power.

How can a remote microgrid reduce diesel consumption?

Design a remote microgrid that complies with IEEE standards for power reliability, maximizes renewable power usage, and reduces diesel consumption. Simulate different operating scenarios, including a feeder switch in secondary substation, diesel trip, diesel planned islanding, and diesel start and resynchronization.

What standards are used to design a remote microgrid?

You also evaluate the microgrid and controller operations against various standards, including IEEE® Std 2030.9-2019, IEC TS 62898-1:2017 and IEEE

Std 2030.7-2017. The planning objectives in the design of the remote microgrid include power reliability, renewable power usage, and reduction in diesel consumption.

What happens if a microgrid goes down?

Microgrids can provide power to important facilities and communities using their distributed generation assets when the main grid goes down. Because electrical grids are run near critical capacity, a seemingly innocuous problem in a small part of the system can lead to a domino effect that takes down an entire electrical grid .
