Overview

What is a phase regulated in a microgrid?

The phase of the inverter voltage is regulated to control the active power output of the inverter. The basic idea behind this strategy is proposed in . The inverter interface with the microgrid can be modeled according to $P_{gen} = V_i V_t \sin(\theta)$ (10) where V_i is the voltage synthesized at the inverter bus.

What is a phase locked loop PI controller?

Controllers for hybrid source microgrid systems The VSI should maintain the frequency and system voltage at the desired value suitable for the connected loads. A phase locked loop is used to generate an angle corresponding to the system's frequency. The section will discuss phase locked loop-based PI controller.

What is a phase locked loop?

The phase locked loop generates an angle (θ) corresponding to the load phase angle which is calculated by the Eq. (1) to obtain the desired system frequency (f). The f in Hz, and the phase angle is in radian. The angle plays a vital role in the load frequency control of a standalone microgrid system.

Can a phase locked loop control a grid side converter (GSC)?

It can be observed, from the results of hardware experimentation, that the proposed-PLL can provide a reasonable estimate of grid phase angle under different scenarios, and hence, suitable for close loop control of grid side converter (GSC). Kaura V, Blasko V (1997) Operation of a phase locked loop system under distorted utility conditions.

What is phase-locked loop synchronization?

Typically, phase-locked loop (PLL) synchronization techniques are used for the grid voltage monitoring. The design and performance of PLL directly affect the dynamics of the RES grid side converter (GSC).

What is a phase-locked loop (PLL)?

The proposed control scheme uses a phase-locked loop (PLL) to establish the microgrid frequency at the inverter terminals, and to provide a phase reference that is local to the inverter. The proposed controller has been tested extensively in simulation and hardware.
