

# Military-Civilian Integration Microgrid

## Overview

---

Why are military microgrids deployed?

Military microgrids are deployed for various reasons such as to increase electrical power security to meet mission requirements, reduce energy life cycle costs, increase utilization of renewable energy resources, and provide a supply of electrical power to remote areas .

How can a military microgrid improve energy security?

Guidance documents for energy security of military microgrids attempt to optimize microgrid design through maximizing the reliability of meeting critical loads given a fixed investment or by targeting a specific reliability value and minimizing a life cycle cost objective function with reliability as a constraint [9, 31, 32].

Can military microgrids be resilient?

The paper presents a systems engineering modeling and analysis method to design military microgrids resilience in the face of disruptions and equipment failures. The method focuses on minimizing mission impact due to threats to energy security and can be applied in the early design phase of a microgrid when only architectural data are available.

Can a microgrid be installed in the DoD?

Currently, for installation-scale microgrids in DoD, most projects include medium or low levels of renewable energy. Several projects with high levels of renewable energy have been developed and successfully executed at DoD installations, but these are typically at smaller scales.

Are DoD installations pursuing microgrids to meet energy resiliency goals?

Department of Defense Instruction 4170.111 requires installations to be more energy resilient, and as a result, many installations are pursuing microgrids to meet their energy resiliency goals and requirements. This report provides a

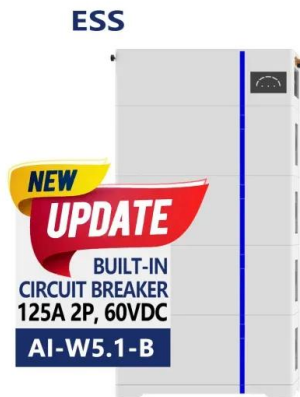

resource for stakeholders involved in analyzing and developing microgrid projects at DoD installations.

Can a military microgrid continue operations while disconnected?

The metric is used in a novel design method to ensure an islanded military microgrid can continue operations while disconnected for a two-week duration. Our model examines the ability to continue mission operations subject to various microgrid disruptions as well as equipment reliability. 1. Introduction
