## Overview

---

A battery is made up of an anode, cathode, separator, electrolyte, and two current collectors (positive and negative). The anode and cathode store the lithium. The electrolyte carries positively charged lithium ions from the anode to the cathode and vice versa through the separator. The movement of the lithium ions.

While the battery is discharging and providing an electric current, the anode releases lithium ions to the cathode, generating a flow of electrons from one side to the other. When.

The two most common concepts associated with batteries are energy density and power density. Energy density is measured in watt-hours.

A lithium-ion or Li-ion battery is a type of that uses the reversible of Li ions into solids to store energy. In comparison with other commercial , Li-ion batteries are characterized by higher , higher , higher , a longer , and a longer . Also not.
