

# Multifunctional solar panel

## Overview

---

Why are multifunctional thin films used in solar panels?

Hence, the surface morphology and characteristics of solar panel surfaces have recently been enhanced using multifunctional thin films or coatings in order to improve their self-cleaning, anti-reflection, anti-fogging and energy transmittance properties of the coated solar panels.

Are solar cover glass coatings multifunctional?

Anti-soiling is the most common property in addition to anti-reflection, and coatings for solar panels should be multifunctional, with other properties such as photoactivity, self-healing, and anti-microbial properties under investigation. Mozumder et al. offers a detailed review of multifunctionality for solar cover glass coatings. 5.

Is a non-porous multilayer coating a spectrally selective filter for solar modules?

This paper aims to develop a non-porous multilayer coating (MLC) that is more durable and will act as a spectrally selective filter for solar modules. Studies have been conducted on MLCs in terms of optical, microstructure, mechanical, and durability properties compared with commercial single-layer AR coatings.

What are the different types of solar panel coatings?

In order to meet the requirement of functionalized solar panel coatings, several different types of coatings, such as, antireflective, self-cleaning (i.e., superhydrophobic/superhydrophilic), photoconductive (i.e., photocatalytic), self-healing, antimicrobial etc. have been proposed by a number of investigators.

Can silica nanoparticles thin film be used for solar panel coating?

Thompson et al. developed silica nanoparticles thin film on glass substrate for solar panel coating. Nanoparticle film was deposited on soda glass using dip

coating method that resulted in silica coatings exhibiting antifogging and self-cleaning properties without relying on photocatalytic materials.

Can coatings improve solar panels' self-cleaning properties?

Coatings of solar panels to increase their self-cleaning property involve two types of films, such as, superhydrophilic and superhydrophobic films. Self-cleaning nano-films are being considered as potential coatings for improving the efficiency of PV modules.
