

# **Name of the State Grid Microfilm**

## Overview

---

The first microform type that can be found in collections is microfilms. Microfilm is a roll or spool of film with sequential frames of images. These film reels look similar to rolls of movie films.

The second type of microform is microfiche. Microfiche are small (10-by-15-cm) flat sheets of plastic with a series of microimages in a grid-like.

Aperture cards are pieces of cardstock that have a single frame of 35mm film mounted into an aperture hole. There are two general formats for aperture cards: Hollerith and Standard.

A microform is a scaled-down reproduction of a document, typically either or paper, made for the purposes of transmission, storage, reading, and printing. Microform images are commonly reduced to about 4% or 1/25 of the original document size. For special purposes, greater optical reductions may be used.

What is the difference between microfiche and microfilm?

Microfiche is like a smaller version of microfilm. Microfiche sheets can be used like a micro-file folder to store and keep related images together. Because of its size, microfiche is typically used for standard page images. Finally, aperture cards are the most basic and smallest microform storage option.

What size is a microfilm roll?

Used to store tiny micro-reproductions of files on a roll of photographic film, microfilm typically comes in two sizes—16mm and 35mm. The typical microfilm roll can store 2,400 letter-sized pages, or 600 drawings and other large images. Unlike how microfilm rolls are a series of images, microfiche is a flat microfilm sheet.

How many pages can a microfilm roll store?

The typical microfilm roll can store 2,400 letter-sized pages, or 600 drawings and other large images. Unlike how microfilm rolls are a series of images, microfiche is a flat microfilm sheet. Usually 105mm x 145mm or 4" x 5", images are organized on a sheet as a matrix. Microfiche sheets can store

roughly 98 letter-sized pages.

Which type of microfilm is best for storing engineering drawings?

As the highest capacity option, microfilm is often used as a backup strategy due to the small size of the microfilm images. Typically, 16mm rolls are used for letter-sized pages (2,400 max), while 35mm rolls are used to store engineering drawings (600 max). Microfiche is like a smaller version of microfilm.

What is a microfilm reel?

Microfilm is a roll or spool of film with sequential frames of images. These film reels look similar to rolls of movie films. Microfilm rolls come in two standard sizes: 16mm and 35mm. The images in these rolls can be master copies, duplicates, positives, or negatives. Proper storage of microfilms is a necessity to protect the collection.

What are the different types of microfilm rolls?

Microfilm rolls come in two standard sizes: 16mm and 35mm. The images in these rolls can be master copies, duplicates, positives, or negatives. Proper storage of microfilms is a necessity to protect the collection. If the cellulose nitrate-based film is not stored properly, it will become flammable and pyrophoric.
