

# Networking type microgrid

## Overview

---

What is a microgrid network?

The primary objective of a network is to share surplus/shortage power with neighbouring microgrids to achieve mutual cost-effective operation, utilising green energy from renewable energy resources in the network and increasing the reliability of customer service.

What are the different types of networked microgrids?

There are two primary types of networked microgrids based on their operational characteristics: predetermined networked microgrids (PNMGs) and dynamic networked microgrids (DNMGs).

What is a predefined networked microgrid?

A predefined networked microgrid maintains a consistent switching status and network configuration regardless of the system's operating conditions and customer priorities. The boundaries of the microgrid are determined based on factors such as supply adequacy, reliability indices, and maximum coverage.

Can networked microgrids revolutionize traditional power grids?

The emerging field of networked microgrids holds the potential to revolutionize traditional power grids, offering increased flexibility, sustainability, and resilience. Utilizing advanced configuration techniques, these networked microgrids can transform the way electricity is generated, distributed, and consumed in the future.

What are dynamic networked microgrids?

Overall, dynamic networked microgrids offer increased flexibility, resilience, optimal resource utilization, scalability, and grid stability, making them a promising solution for efficient and sustainable power distribution in the evolving energy landscape.

Do networked microgrids have energy optimisation problems?

This article classifies networked microgrids on the basis of network formation and provides an overview of recent research on control of networked microgrids. In addition, a state-of-the-art review of optimisation methods is provided to solve the energy optimisation problem in networked microgrids.
