

PCs cost in energy storage system

Overview

What are PCs and energy related costs?

PCS costs of the EES system are typically explained per unit of power capacity (€/kW). Energy related costs include all the costs undertaken to build energy storage banks or reservoirs, expressed per unit of stored or delivered energy (€/kWh).

What are the costs of a power conversion system (PCS)?

It includes the costs of the power conversion system (PCS), costs associated with energy consumption and purchase, acquisition costs, cost for storage units (CSU)—costs related to energy storage (components of EnWheel modules), installation and delivery of the ESS unit, or cost of balance of the plant—BOP.

How much does PCs cost?

In addition to the specific features of the site, the cost of storage depends on the plant size, 69 \$/kWh (52 €/kWh) for a 14.4 GWh plant while 103 \$/kWh (77 €/kWh) for 11.7 GWh storage capacity . The results of this study show the cost of PCS of 513 €/kW and storage cost of 68 €/kWh, on average.

Are mechanical energy storage systems cost-efficient?

The results indicated that mechanical energy storage systems, namely PHS and CAES, are still the most cost-efficient options for bulk energy storage. PHS and CAES approximately add 54 and 71 €/MWh respectively, to the cost of charging power. The project's environmental permitting costs and contingency may increase the costs, however.

What is a power conversion system (PCS)?

The PCS is the intermediary device between the storage element, typically large banks of (DC) batteries, and the (AC) power grid. AC/DC and DC/AC conversion takes place in the power conversion system (PCS). The energy

flows into the batteries to charge them or is converted to AC from the battery storage and fed into the grid.
