One of the key virtues of a passive solar-heated home is how passive it is. Once the elements of a passive solar heating system are created, the home heats itself, quietly and with little human intervention. Here are some important considerations.

While passive solar heating and cooling works better in some places than others, its efficiency and simplicity mean it works in more places than.

The technology used to support passive solar heating keeps improving, with new glass materials, glazing processes, more efficient insulation, digital tools to measure solar radiation, window performance, and energy use making it easier to plan and design a successful.

Technically, PSH is highly efficient. Direct-gain systems can utilize (i.e. convert into "useful" heat) 65–70% of the energy of solar radiation that strikes the aperture or collector. Passive solar fraction (PSF) is the percentage of the required heat load met by PSH and hence represents potential reduction in heating costs. RETScreen International has reported a PSF of 20–50%. Within the field of , energy conservation even of the order of 15% is consid.
