

Photovoltaic effect meaning in hindi

Overview

PHOTOVOLTAIC EFFECT = The process by which sunlight is converted into electricity. Usage : The photovoltaic effect is the process by which sunlight is converted into electricity. It is a physical phenomenon. The photovoltaic effect is closely related to the photoelectric effect. For both phenomena, light is absorbed, causing excitation of an electron or other charge carrier to a higher-energy state. The main distinction is that the term photoelectric effect is now usually used when the electron is ejected out of the material (usually into a vacuum) and photovoltaic effect used when the excited charge carrier is still contained within the material.

The photovoltaic effect is the generation of voltage and in a material upon exposure to . It is a phenomenon. The photovoltaic effect is closely related to the . PHOTOVOLTAIC EFFECT = Usage : The photovoltaic effect is the process by which sunlight is converted into electricity. : What is photovoltaic effect?

The photovoltaic effect is the generation of voltage and electric current in a material upon exposure to light. It is a physical phenomenon. The photovoltaic effect is closely related to the photoelectric effect. For both phenomena, light is absorbed, causing excitation of an electron or other charge carrier to a higher-energy state.

What is the difference between photoelectric effect and photovoltaic effect?

The main distinction is that the term photoelectric effect is now usually used when the electron is ejected out of the material (usually into a vacuum) and photovoltaic effect used when the excited charge carrier is still contained within the material.

When was the photovoltaic effect first demonstrated?

The first demonstration of the photovoltaic effect, by Edmond Becquerel in 1839, used an electrochemical cell.

What is the difference between photoelectric emission and photovoltaic emission?

The physical essence of the difference is usually that photoelectric emission separates the charges by ballistic conduction and photovoltaic emission separates them by diffusion, but some "hot carrier" photovoltaic devices concepts blur this distinction.

What is AC PV effect?

The AC PV effect is based on the capacitive model that the current strongly depends on the frequency of the chopper. The AC PV effect is suggested to be a result of the relative shift and realignment between the quasi-Fermi levels of the semiconductors adjacent to the junction/interface under the nonequilibrium conditions.

How does VOC affect the behavior of PV cells under varying conditions?

The first studies about the behavior of PV cells under varying conditions of G and T date back several decades ago.¹⁻⁴ In general, it is known that VOC shows a significant inverse correlation with T, whereas for ISC that correlation is direct, but weaker, so that this increment does not compensate for the decrease of VOC.

Photovoltaic effect

The first demonstration of the photovoltaic effect, by Edmond Becquerel in 1839, used an electrochemical cell. He explained his discovery in Comptes rendus de l'Académie des sciences, "the production of an electric current when two plates of platinum or gold immersed in an acid, neutral, or alkaline solution are exposed in an uneven way to solar radiation."

Photovoltaic (PV) power generation is the main method in the utilization of solar energy, which uses solar cells (SCs) to directly convert solar energy into power through the PV effect. However, the application and development of SCs are still facing several difficulties, such as high cost, relatively low efficiency, and greater influence from external conditions.
