

Photovoltaic inverter cooling

Overview

Can a cooling system reduce a PV system temperature?

The proposed system was able to reduce a PV system temperature by up to 16.7 C and increase power output by over 9%. An international research team has designed a novel cooling system for PV modules involving a phase change material (PCM), heat sink fins, and water.

Do PV modules need cooling technologies?

Many cooling technologies have been developed and used for PV modules to lower cell temperature and boost electric energy yield. However, little crucial review work was proposed to comment cooling technologies for PV modules.

What is a passive cooling system for PV modules?

An international research team has designed a novel cooling system for PV modules involving a phase change material (PCM), heat sink fins, and water. The experimental system utilizes passive cooling, as it uses the latent heat of fusion of PCM and the latent heat of evaporation of water.

What are the different types of PV cooling techniques?

Recent studies varies from types of cooling techniques (e.g., active and passive, radiative, absorption based, etc) to cooling for different sorts of PV systems (e.g., concentrated PV systems, hybrid PV/T systems, etc). However, most of these cooling systems are based on active cooling technique and utilises external energy for cooling purpose.

How can a solar PV system be cooled?

Another conventional approach for cooling of PV systems was the utilisation of wind instead of water. In 2014, M. Rahimi and others designed and constructed a cone shaped wind collecting cooling device which not only cooled the PV cell but also acted as a turbine for producing electricity, thereby enabling dual advantage.

How does active cooling affect the energy conversion of PV systems?

Most of the research is done in the field of active cooling, which uses external energy (e.g., water and air) to cool the system down, and on utilisation of the thermal energy for heating applications. This extra energy requirement of the cooling systems increases load on the system and affects the efficiency and energy conversion of PV systems.
