## Overview

---

How much energy can a solar microgrid provide?

Some of our solar microgrid systems have a capacity as small as 1.5kw, providing reliable energy to 25 homes and 5 businesses. Other microgrids are expected to have a capacity closer to 15kw, enough energy to power hundreds of households and small businesses.

Can a microgrid be commercialized?

Even if all of these technical and regulatory barriers would be alleviated, the commercialization of the microgrid concept heavily depends on the reduction of production costs of renewable energy generation, storage technologies, and energy management systems.

Are solar microgrids sustainable?

Solar microgrids have a lot of potential as a renewable energy solution. However, they will not be sustainable and profitable without the direct involvement, training, and cooperation of communities. This is why we put communities at the centre of our work - working with them from day one to create a long-term vision and management plan.

Are there barriers to implementing a microgrid in the real world?

The main aim of this research is to identify the common barriers and ultimate success factors to implementing a microgrid in the real world. We found that microgrids vary significantly depending on location, components, and optimization goals, which cause them to experience different types of challenges and barriers.

Are solar-based microgrids a viable alternative to the central grid in Puerto Rico?

Following Maria, businesses in Adjuntas struggled to obtain enough diesel and spent thousands of dollars on fuel to keep their generators operating—an

expense that sorely tested them. Sunlight, though, is a free and abundant energy source in Puerto Rico, and solar-based microgrids have proven to be a reliable alternative to the central grid.

Are microgrids a potential for a modernized electric infrastructure?

1. Introduction Electricity distribution networks globally are undergoing a transformation, driven by the emergence of new distributed energy resources (DERs), including microgrids (MGs). The MG is a promising potential for a modernized electric infrastructure , .
