## Overview

---

PV cells are manufactured as modules for use in installations. Electrically the important parameters for determining the correct installation and.

Nominal rated maximum (kWp) power out of a solar array of  $n$  modules, each with maximum power of  $W_p$  at STC is given by: The available solar radiation ( $E_{ma}$ ) varies depending on the time of.

Efficiency: measures the amount of solar energy falling on the PV cell which is converted to electrical energy Several factors affect the measurement of PV efficiency, including: 1. wavelength - PV cells respond differently to.

As the temperature of PV cells increase, the output drops. This is taken into account in the overall system efficiency ( $\eta$ ), by use of a temperature derating factor  $\eta_{td}$  and is given by: .

To understand the performance of PV modules and arrays it is useful to consider the equivalent circuit. The one shown below is commonly employed. PV module equivalent circuit From the.

How is a PV module's I-V curve generated?

A PV module's I-V curve can be generated from the equivalent circuit (see next section). Integral to the generation of the I-V curve is the current  $I_{pv}$ , generated by each PV cell. The cell current is dependant on the amount of light energy (irradiance) falling on the PV cell and the cell's temperature.

What is a series connected PV module?

The entire string of series-connected modules is known as the PV module string. The modules are connected in series to increase the voltage in the system. The following figure shows a schematic of series, parallel and series parallel connected PV modules. PV Module Array To increase the current  $N$ -number of PV modules are connected in parallel.

What is the relationship between PV module voltage and current?

Figure 2.7 shows the relationship between the PV module voltage and current

at different solar irradiance levels. The image illustrates that as irradiance increases, the module generates higher current on the vertical axis. Similarly, we can observe the voltage and power relationship of a PV module at different irradiance levels.

How do PV cells generate a tie I-V curve?

Integral to the generation of tie I-V curve is the current  $I_{pv}$ , generated by each PV cell. The cell current is dependant on the amount of light energy (irradiance) falling on the PV cell and the cell's temperature. As the irradiance decreases not only is the amount of power reduce, but the peak power point moves to the left.

How to increase the current N-number of solar PV modules?

To increase the current N-number of PV modules are connected in parallel. Such a connection of modules in a series and parallel combination is known as "Solar Photovoltaic Array" or "PV Module Array". A schematic of a solar PV module array connected in series-parallel configuration is shown in figure below. Solar Module Cell:.

How does irradiance affect the power of a PV module?

Similarly, we can observe the voltage and power relationship of a PV module at different irradiance levels. We can see that as irradiance increases, the module is able to generate more power, represented by higher peaks on the curves in Figure 2.8.
