

Photovoltaic solar power generation saves coal

Overview

Can solar photovoltaic technology offset coal-fired power plants?

It has been proposed that the GHG emissions from coal-fired power plants can be offset by carbon capture and sequestration or bio-sequestration. However, solar photovoltaic (PV) technology has recently declined so far in costs it now offers both technical and economic potential to offset all of coal-fired electricity use.

Will solar power save the world?

Replacing the costliest 500 GW of coal with solar PV and onshore wind next year would cut power system costs by up to USD 23 billion every year and reduce annual emissions by around 1.8 gigatons (Gt) of carbon dioxide (CO₂), equivalent to 5% of total global CO₂ emissions in 2019.

Can solar energy reduce coal consumption?

During daylight operation, solar energy can be used to reduce coal consumption (coal-reducing mode). As solar radiation decreases during the latter part of the day, the coal contribution can be increased, allowing the plant's boiler to always operate at full load.

Could coal and solar power be combined?

The pairing of coal and solar energy may seem an unlikely combination, but under the appropriate circumstances, could offer an elegant solution to combining the reliability and cost-effectiveness of large-scale coal-fired generation with an emissions-free form of renewable energy.

Are photovoltaic farms a viable solution to climate-neutral coal fired electricity generation?

Carbon capture and storage and enhanced oil recovery can improve coal performance, but for all cases the results clearly show that PV is a far more effective use of land. Overall, for the first time this study found climate-neutral

photovoltaic farms are a preferred solution to climate-neutral coal fired electricity generation.

How can a coal-fired power plant improve efficiency?

Coal-fired power operators continue to look for ways to increase the efficiency and extend the working lives of their plants by improving operational flexibility and reducing environmental impact. Two possible options are explored here: combining solar energy with coal-fired power generation, and cofiring natural gas in coal-fired plants.
