

# **Poly 3 hexylthiophene fibers for photovoltaic applications**

## Overview

---

Regioregular poly (3-hexylthiophene) (P3HT) as one of the most commonly used and thoroughly studied homopolymers has been demonstrated to be a promising commercial candidate for large-area, roll-to-roll printed solar cells. What is poly (3-hexylthiophene)?

Poly (3-hexylthiophene) (P3HT) is an organic semiconductor that has been mainly used for the fabrication of transistors, photovoltaic cells, strain sensors, and light emitting devices. P3HT appears to be the most commonly used CP in organic photovoltaics because of its desirable electronic properties

What is P3HT (poly-3 hexylthiophene)?

Poly (3-hexylthiophene) (P3HT) is an alternative hole-transport material with excellent optoelectronic properties 11, 12, 13, low cost 8, 14 and ease of fabrication 15, 16, 17, 18, but so far the efficiencies of perovskite solar cells using P3HT have reached only around 16 per cent 19.

Is poly-3-hexylthiophene a regioregular hole conductor?

Poly (3-hexylthiophene) (P3HT) remains of significant importance as a prototypical benchmark hole conductor material in Organic Photovoltaics (OPVs). In this review we discuss synthetic strategies to P3HT, particularly focusing on those leading to the regioregular form and discussing key physical and morphological properties.

Can P3HT be used as a hole transport material in perovskite solar cells?

Despite the potential advantages of P3HT as an organic hole-transport material (HTM) in perovskite solar cells (Extended Data Table 1), the resulting devices have a low open-circuit voltage (VOC) due to additional non-radiative recombination at the perovskite/P3HT interface 20.

Can P3HT be used as a hole transport material?

Here we propose a device architecture for highly efficient perovskite solar cells that use P3HT as a hole-transport material without any dopants. A thin layer of wide-bandgap halide perovskite is formed on top of the narrow-bandgap light-absorbing layer by an in situ reaction of n-hexyl trimethyl ammonium bromide on the perovskite surface.

What wt% p3ht/pvdf-HFP is used for electrospinning to produce nanofibers?

A concentration of 17 wt% PVDF-HFP in the THF solution was used for electrospinning to produce the nanofibers. The composite solution of P3HT/PVDF-HFP in the THF solution was prepared by continuous stirring of a mixture of 3 wt% P3HT with PVDF-HFP/THF.

### Facile synthesis of water-dispersible poly(3-hexylthiophene)

poly(3-hexylthiophene) (P3HT) are hydrophobic and they cannot be processed in water. We herein report a facile yet high photovoltaic device applications (Tang et al., 2011; Tokuhisa and

### Poly(3-hexylthiophene-2,5-diyl) regioregular (P3HT) thin film as

Q-switched and mode-locked Erbium-doped fiber lasers (EDFLs) were demonstrated using poly(3-hexylthiophene-2,5-diyl) regioregular (P3HT) organic semiconductor in the form of thin film as a saturable absorber (SA). The P3HT thin film is cut into small pieces and sandwiched between two ferrules in EDFL cavity to generate a stable Q-switching and ...

### Review A comprehensive review on poly(3-alkylthiophene)-based

Poly(3-alkylthiophenes) (P3ATs) particularly poly(3-hexylthiophene) (P3HT) have a vigorous tendency to crystallize into the ordered morphologies, there...

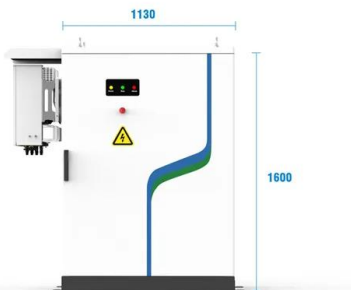

### High-Efficiency Organic Solar Cells Based on Preformed Poly (3

Bulk heterojunction solar cells based on blends of poly(3-hexylthiophene) (P3HT) and phenyl-C61-butyric acid methyl ester (PC61BM) are fabricated using self-assembled P3HT nanowires in a marginal solvent without post-treatments. The interconnected network structures of self-organized P3HT nanowires create continuous percolation pathways through the active ...

### Study of photoexcitations in poly (3-hexylthiophene) for photovoltaic

Conducting poly (3-hexylthiophene) (P3HT) was synthesized electrochemically in aqueous medium and characterized by electrochemical impedance spectroscopy, Tafel, SEM and TEM.

- PV / DG Application
- APP Intelligent Control
- Multi-Unit Parallel Expansion
- 98.8% Max. Efficiency

### Thermally stable poly(3-hexylthiophene): Nonfullerene ...

Blends of poly(3-hexylthiophene) (P3HT) and organic electron acceptor (fullerene, rylene diimide, 2.1 Photovoltaic performance and thermal stability To gain a thorough understanding of how the performance and its ...

### A Photovoltaic Fiber Design for Smart Textiles

We report on the fabrication of an electrospun regio-regular poly(3-hexylthiophene-2,5-diyl) fiber field effect transistor (FET). The hole mobility of the device was calculated to be  $4 \times 10^{-4} \text{cm}^2$
