

Popular Science Space Solar Panels

Overview

What is space solar power?

Space solar power provides a way to tap into the practically unlimited supply of solar energy in outer space, where the energy is constantly available without being subjected to the cycles of day and night, seasons, and cloud cover—potentially yielding eight times more power than solar panels at any location on Earth's surface.

Could space based solar power be a viable alternative to nuclear power?

"The thing with space based solar power is that very high levels of power can be delivered, similar to nuclear power plants," Wilson said. "Most other renewable energy options can't provide such quantities at once. Without space-based solar power, we would probably be looking to build many more nuclear power stations, for sure."

Would a solar power plant in space work?

Unlike solar panels on Earth, a solar power plant in space would provide a constant power supply 24/7. When you purchase through links on our site, we may earn an affiliate commission. Here's how it works. A first-of-its-kind lab demonstration shows how solar power transmission from space could work.

Can solar power power the International Space Station?

"Solar panels already are used in space to power the International Space Station, for example, but to launch and deploy large enough arrays to provide power to Earth, SSPP has to design and create solar power energy transfer systems that are ultra-lightweight, cheap, and flexible."

What is space-based solar power?

Space-based solar power involves putting photovoltaics in geostationary orbit—the same place where we have weather satellites—and sending the energy they collect back to Earth via a microwave power beam. The microwave power

from space-based solar would be received at a power station and used to generate electricity.

Can solar power be used in space?

The European Space Agency (ESA) has eyed space-based solar power since the beginning of this year. As of August, the agency is considering developing a program to start generating energy with photovoltaics in space.
