

Self-generated solar air conditioning

Overview

The simplest form of solar air conditioning is a small solar panel that generates enough electricity to run a fan—for example, to cool an attic. More advanced and powerful systems use air conditioners that run just like any window air conditioner—by transferring heat from one place to another using.

A small solar-powered air conditioner can work well to keep an attic cool and dry. The unit sits on a shingle roof, just as an attic vent might. These.

Installing a larger solar air conditioning system can be costly, depending on labor and permitting costs in your area. It may be more cost-effective to install enough solar panels to run your entire house and use solar electricity to run.

Modern solar air conditioning is a relatively recent technology, so the terminology can be confusing and subject to change. Even the very term “solar air conditioning” can mean different things to different people. Prices, too, are bound to.
