Overview

The smart grid is an enhancement of the 20th century electrical grid, using two-way communications and distributed so-called intelligent devices. Two-way flows of electricity and information could improve the delivery network. Research is mainly focused on three systems of a smart grid - the infrastructure system.

Historical development of the electricity grid
The first system was installed in 1886 in .

The bulk of smart grid technologies are already used in other applications such as manufacturing and telecommunications and are being adapted for use in grid operations.

Major programs
IntelliGrid - Created by the Electric Power Research Institute (EPRI), IntelliGrid architecture provides methodology, tools, and recommendations for standards and technologies for utility use in planning, specifying, and procuring.

Before a utility installs an advanced metering system, or any type of , it must make a business case for the investment. Some components, like the power system.

A smart grid would allow the power industry to observe and control parts of the system at higher resolution in time and space. One of the purposes of the smart grid is real time information exchange to make operation as efficient as possible. It would allow management.

Market outlook
In 2009, the US smart grid industry was valued at about \$21.4 billion - by 2014, it will exceed at least \$42.8.

Most opposition and concerns have centered on smart meters and the items (such as remote control, remote disconnect, and variable.
