

# Six star solar system

## Overview

---

TIC 168789840, also known as TYC 7037-89-1, is a system with six stars. Three pairs of stars orbit a common center. While other systems with three pairs of stars have been discovered, this was the first system where the stars can be observed one after another, as the system lies approximately on their planes of rotation.

What is a 6 star system?

In late January 2021, astronomers said they'd found a six-star system - three pairs of double stars - all producing eclipses as seen from our earthly vantage point. The system is labeled as TYC 7037-89-1 (or TIC 168789840), and it's located about 1,900 light-years away in the direction of the constellation Eridanus the River.

Did astronomers discover a six-star system?

But recently astronomers announced something unique in their experience. In late January 2021, they said they'd found a six-star system - three pairs of double stars - all producing eclipses as seen from our earthly vantage point.

Where is the first six-star system?

Astronomers found the first six-star system where all of the stars participate in eclipses, a discovery made by NASA's Transiting Exoplanet Survey Satellite (TESS). The system is about 1,900 light-years away in the constellation Eridanus.

Can all 6 stars be seen from Earth?

An international team of astronomers has discovered a unique 6-star system where eclipses of all 6 stars can be seen from Earth.

Can a six-star system eclipse a sextuple star system?

A handful of other six-star systems have been discovered, but this one is unique. The Transiting Exoplanet Survey Satellite, launched in 2018, recently observed a sextuply eclipsing sextuple star system 1,900 light-years away. NASA.

How many stars are in a star system?

Most stars, though, even those we see as single, reside in multiple star systems. Many systems have two, three or more stars. Some are even known to have as many as six stars. Imagine viewing that from a nearby planet! But recently astronomers announced something unique in their experience.

## Six star solar system

### In Depth , Our Solar System - NASA Solar System Exploration

Formation Formation Our solar system formed about 4.5 billion years ago from a dense cloud of interstellar gas and dust. The cloud collapsed, possibly due to the shockwave of a nearby exploding star, called a supernova. When this dust cloud collapsed, it formed a

### Solar System

They are confident that this body is from another star system and has traveled into our solar system from interstellar space. By providing a detailed look at the planets, moons, rings, asteroids, comets, and other objects in our celestial backyard, Hubble is helping to answer age-old questions about how the solar system began, how planets formed, and how the Earth ...

### Multiple Star Systems

Multiple Star Systems Our solar system, with its eight planets orbiting a solitary Sun, feels familiar because it's where we live. But in the galaxy at large, planetary systems like ours are decidedly in the minority. More than half of all

stars in the sky have one or more partners. These multiple star systems come [...]

### Discovery of six-planet solar system wows astronomers

That's the case at least for a rare six-planet solar system whose discovery has wowed astronomers, even in an era when detecting planets around distant stars has become a common occurrence.

### Solar System

A star system is a group of planets, meteors, or other objects that orbit a large star. While there are many star systems, including at least 200 billion other stars in our galaxy, there is only one solar system. That's because our sun is known by its Latin name, Sol. The solar system includes everything that is gravitationally drawn into the sun's orbit. Use these resources to learn about ...

### Planets of our Solar System

In the centre of the Solar System is the Sun, our star. It is a huge ball of burning gas made mostly of hydrogen. The Sun makes up 99% of all the mass in the Solar System; that means if you put

## GEH 5-10kW Solar System
