## Overview

---

What role does the skeleton play in systemic energy metabolism?

In addition to its roles in mechanical support and hematopoiesis, the skeleton functions as an endocrine organ, playing a pivotal role in both local bone metabolism and the regulation of systemic energy metabolism (Table 1).

Table 1. Effects of bone-derived endocrine factors on systemic energy metabolism

How does the skeleton function?

The skeleton is diverse in its functions, which include mechanical support, movement, blood cell production, mineral storage and endocrine regulation. This multifaceted role is achieved through an interplay of osteoblasts, chondrocytes, bone marrow adipocytes and stromal cells, all generated from skeletal stem cells.

What is the role of bone in energy metabolism?

The bone serves as an energy reservoir and actively engages in whole-body energy metabolism. Numerous studies have determined fuel requirements and bioenergetic properties of bone under physiological conditions as well as the dysregulation of energy metabolism associated with bone metabolic diseases.

Why do bone cells consume so much energy?

The first general principal is that the sheer size of the total bone cell mass would consume a significant proportion of the body's overall fuel supply and consequently are in competition with other energy-consuming tissues.

What is a super battery skeleton?

Skeleton's SuperBattery technology is a fast-charging, high power battery technology, filling the technology gap between supercapacitors and batteries. SuperBatteries offering the ideal combination of energy, power, and safety for

<30-minute applications. What's the difference between ultracapacitors and supercapacitors?

.

What role does the skeleton play in metabolic homeostasis?

Understanding bone-fat interactions requires a comprehensive analysis of the physiology of skeleton, its regulatory role in intermediary metabolism, and its utilization of energy. This aspect of bone biology promises that more provocative data will emerge showing the integrative role of the skeleton in metabolic homeostasis.
