

Solar fixed support system diagram

Overview

What is a fixed solar panel system?

A fixed system that is mounted to a certain position as shown in Figure 1. The orientation of the solar panel array is adapted to the installation site so that the efficiency of the system is optimized. An adjustable system that features mechanisms to enable it to be automatically rotated around 2 axes as shown in Figure 2.

Why should you choose a fixed panel solar system?

Fixed panel designs can be tailored to fit the highest quantity of panels at each site. As more solar PV is installed and the power generated is injected into the grid in the central hours of the day, it causes the market price of energy to fall sharply, cannibalizing its own profit.

Can a solar array support structure withstand a wind load?

Even fixed solar array support structures have sophisticated design, that needs to be analyzed and often improved in order to withstand the wind load. The same applies of course to adjustable designs to an even greater extent. The analysis has to be carried out for many wind directions.

How long do solar panel support structures last?

International regulations as well as the competition between industries define that they must withstand the enormous loads that result from air velocities over 120 km/h. Furthermore, they must have a life expectancy of more than 20 years. In this paper, the analysis of two different design approaches of solar panel support structures is presented.

How many types of mounting structure for solar module design?

There are three main types of mounting structure for solar module design. In this post, we look at each one and how they work at two plants in Europe. Find the whole engineering documentation for each project at the end of the

article. Get the 300 pages of technical documentation for each structure type. Download sample documentation.

How does a fixed-tilt PV system work?

Rather than using a tracker structure that adjusts the angle of PV panels to follow the sun during the day, a fixed-tilt structure angles panels towards the equator, so the angle depends on the latitude of the site. Panels are tilted towards the south in the northern hemisphere and towards the north in the southern hemisphere.
