## Overview

---

How does Magma Energy work?

Magma energy. Super-hot magma steam is pumped from underground into a heat exchanger, where it passes over pipes filled with water that boils to form steam. This steam comes screaming out of the heat exchanger, spinning a turbine to generate electricity.

Can Magma Energy be extracted from a power plant?

The magma's lid is  $< 20$  m with a thermal gradient of  $> 20^{\circ}\text{C}/\text{m}$ , yielding a heat flow of  $> 40$  W/m<sup>2</sup> and a characteristic response time of about one year or less, well within the lifetime of a power plant. Thus, extracting superheated fluid from adjacent the magma body would in effect be using magma energy.

Could geothermal power magma?

Tapping into magma's extreme heat right at the source would be geothermal on steroids. Rather than the mix of water and steam brought to the surface with conventional geothermal, what they would get from magma is a super-hot steam with a much higher energy density. Magma energy.

Can magma be used for energy?

To use the magma for energy, workers wouldn't drill directly into it. Instead, they could either tap into superhot water in nearby magma-heated rock and use its steam to turn turbines, or make artificial steam by injecting water from the surface.

Could Magma Energy be used for Next-Gen geothermal systems?

A team of international scientists working at the Krafla Magma Testbed (KMT) in Iceland are exploring how energy extracted directly from magma could be used for next-gen geothermal systems. Geothermal energy is a largely unexplored renewable resource.

How can geothermal energy be used to generate electricity?

To harness this energy to generate electricity, engineers identify areas where magma is near the surface and . These wells bring steam to the surface, where it is directed into a power plant to spin turbines and generate electricity. Earth's heat can be converted into geothermal energy in several different ways.
