

Solar power generation at high altitudes

Overview

Does altitude affect photovoltaic power?

The gathered data shows a higher photovoltaic power yield in the higher altitude test site. Furthermore, the high altitude photovoltaic power as a function of azimuth and elevation angle appears to be not only higher but also more flat than in lower altitudes. This indicates a lower power loss in case of deviation from the optimal solar angles.

Should high-altitude floating solar technology be on the Global RADAR?

Overall, our results suggest that high-altitude floating solar technology should be on the global radar for alternative utility-scale solar electricity technologies. The prospect of utility-scale production and homogeneous spaces presents the technology as a solid option for large-scale expansions in mountainous regions.

Can solar power be harvested in mountainous areas?

An economic aspect of solar power harvesting in mountainous areas is the cost of land. Prices of high altitude parcels could be expected to be lower due to their remote locations. Steep slopes and high distances to socio-economic centers make it less attractive for residential building projects.

How can high-altitude floating solar improve site profitability?

Combining high-altitude floating solar with storage technology would also increase site profitability by enabling the sale of generated power at higher prices. This may be achieved through integration with associated hydro pumped-storage facilities.

Does solar irradiation affect output power?

In general, solar power generation works better in area with large solar irradiation. Studies have shown the potential in tropical (Farhoodnea et al. 2015) and deserted (Kazem et al. 2014) environments. However, output

power of PV system does not only depend on the absorbed power but is also affected by PV module's temperature.

Can high-altitude floating solar power solve Switzerland's capacity expansion problem?

As a result, we find that large-scale high-altitude floating solar power can significantly contribute to solving Switzerland's capacity expansion problem - with numerous similar potential applications worldwide.
