

# Solar power generation brings electricity with you

## Overview

---

How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How is solar energy used?

Solar power is used in two main ways: generating electricity (like with rooftop solar panels) or generating thermal energy (like with concentrated solar power plants). For most homeowners, solar panels that convert solar energy to electricity are the best use of solar energy because it allows them to save on electric bills.

Should you use solar power to generate electricity at home?

Using solar power to generate electricity at home is a very appealing option for a number of reasons: not only would you be reducing your overall environmental footprint and greenhouse gas emissions, but you would be reducing your bills and could even generate some income by selling back excess energy into the grid.

How do you use energy from the Sun?

The two main ways to use energy from the sun are photovoltaics and solar thermal capture. Solar photovoltaic systems are common for smaller-scale electricity projects (like home solar panel installations ), while solar thermal capture is typically only used for electricity production on massive scales in utility solar installations.

Does solar energy produce more electricity in summer?

According to Solar Energy UK, solar panel performance falls by 0.34

percentage points for every degree that the temperature rises above 25°C. Plus, the longer days and clearer skies mean solar power generates much more electricity during the summer, even if their efficiency falls slightly. Is solar energy expensive to produce?

.

How do solar panels convert solar energy into electricity?

Solar panels convert solar energy into usable electricity through a process known as the photovoltaic effect. The photovoltaic effect is a property of specific materials called semiconductors (nonmetals with conductive properties) that enables them to create an electric current when exposed to sunlight.
