

Solar power generation directly connected to the mains

Overview

Why should a solar PV system be connected to the grid?

For financial benefit. Connecting your solar PV system to the grid allows you to take advantage of the FIT, which gives you a fixed amount of money for each kWh of electricity you generate. On top of these payments for energy generation, you also receive a sum of money for feeding any surplus energy into the grid.

Can solar systems integrate with power systems?

Renewable energy source integration with power systems is one of the main concepts of smart grids. Due to the variability and limited predictability of these sources, there are many challenges associated with integration. This paper reviews integration of solar systems into electricity grids.

How does a solar PV system work?

As shown in Fig 1, the PV system incorporates a number of PV modules which convert the energy of solar radiation emitted by the sun into electrical energy by means of the photovoltaic effect. The modules are connected into series 'strings' to provide the required output voltage and arranged into one or more arrays.

Can a photovoltaic system be connected to a building electrical installation?

Indeed, a photovoltaic system can be connected to the building electrical installation at different places: to the main low-voltage (LV) switchboard, to a secondary LV switchboard, or upstream from the main LV switchboard. These options, their advantages and drawbacks are discussed in this blog post. 1.

How do solar panels work?

The solar panels on your roof convert sunlight into electricity which can be used in your home for free, saving you money. This booklet explains more about how your solar PV (photovoltaic) system works, when it generates

electricity and how to maximise your use of this free electricity. Useful information - talking electricity - what is a Watt?
