

Switching power supply with battery backup

Overview

What is a back-up power supply solution?

This application note details a back-up power supply solution that uses a voltage supervisor to monitor a main power rail and if the main power rail falls to an undervoltage condition, a secondary power rail from a back-up battery is automatically switched into the system to provide continuous power to the output.

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS), also known as a battery backup, provides backup power when your regular power source fails or voltage drops to an unacceptable level. A UPS allows for the safe, orderly shutdown of a computer and connected equipment. The size and design of a UPS determine how long it will supply power.

Do I need a back-up battery or secondary power rail?

There are several key applications that require back-up battery or secondary power rail. In industrial applications, often times if the main power rail fails, a back-up battery is required to supply power to the system long enough to save data or send communications before shutting down.

How can I use a line-powered switching power supply instead of a battery?

simulate this circuit - Schematic created using CircuitLab If you always want to use the line-powered switching power supply in preference to the solar-charged battery, then arrange that power supply to put out a little higher voltage than the battery. It doesn't need to be much, even just a few 100 mV would do it.

Why do I need a back-up battery?

For the portable or battery powered applications, a back-up battery is used to preserve data and send communications if needed before shutting down.

Often times these devices utilize volatile memory such as DDR SDRAM to save data and volatile memory requires power otherwise the data is lost.

What is a standby UPS & how does it work?

Standby is the most basic UPS topology. A standby UPS resorts to battery backup power in the event of common power problems such as a blackout, voltage sag, or voltage surge. When incoming utility power drops below or surges above safe voltage levels, the UPS switches to DC battery power and then inverts it to AC power to run connected equipment.

A UPS back up battery can be connected to your door lock systems, thus keeping it online even in the absence of power supply. If and when you need backup battery in Malaysia, VSH technology has a broad range of UPS backup batteries for sale to homes and businesses in Malaysia.

What Is a Battery Backup? (Uninterruptible Power Supply)

A battery backup, aka UPS (Uninterruptible Power Supply), is a device that provides backup power and consistent electricity to a computer system. Battery Backups: What They Look Like The front of the battery backup will usually have a power switch to turn the device on and off and will sometimes have one or more additional buttons that perform various functions.

A Complete Guide to Solar Automatic Transfer Switch

Test automatic transfer switch by disconnecting the power from your solar system and making sure that the switch properly transfers the power to your backup generator. With most models of a solar battery or solar panel automatic transfer switch, the installation process is relatively simple and can be done by anyone with basic electrical knowledge.
