

# **Synchronous speed of wind turbine generator**

## Overview

---

Are synchronous generators suitable for variable speed wind turbines?

Synchronous generators are commonly used for variable speed wind-turbine applications, due to their low rotational synchronous speeds that produce the voltage at grid frequency. Synchronous generators can be an appropriate selection for variable speed operation of wind turbines [166, 167]. They do not need a pitch control mechanism.

What are the different types of wind energy conversion technologies?

In the fields of renewable energy research, wind energy conversion technologies are gaining popularity. The squirrel cage induction generator (SCIG), doubly fed induction generator (DFIG), wound field synchronous generator (WFSG), and permanent magnet synchronous generator (PMSG) are the most often utilized generators with WECSs.

How to choose a wind turbine generator?

Among others is the design of the wind turbine generator. The desired generator should be small and light weight but such design always leads to a tradeoff in the output power aspect, . Permanent Magnet Synchronous Generator (PMSG) and Doubly Fed Induction Generator (DFIG) are most commonly used in wind turbine.

Can hybrid excitation permanent magnet synchronous generator (hpmsg) track wind turbine power?

This paper investigates a novel control strategy that enables hybrid excitation permanent magnet synchronous generator (HPMSG) to track the optimal extracted power of the modern wind turbine type (.).

What are the different types of wind turbine generators?

The squirrel cage induction generator (SCIG), doubly fed induction generator (DFIG), wound field synchronous generator (WFSG), and permanent magnet

synchronous generator (PMSG) are the most often utilized generators with WECSs. Table 1 shows a comparison of different types of wind turbines [ 13, 14 ].

What is a synchronous generator?

The synchronous generator is a generator, which operates at the synchronous speed, dictated by the frequency of the connected grid, regardless of the magnitude of the applied torque. The magnetic field in the synchronous generator can be created by using permanent magnets or with a conventional field winding.
