## Overview

---

Are solar panels prone to wear and tear?

The solar industry has seen rapid advancements over the past few decades. With increasing global emphasis on renewable energy, solar technology has evolved, leading to more efficient and longer-lasting panels. However, just like any other technological device, solar panels are not immune to wear and tear.

Do solar panels degrade?

As your solar panels age, you may start to notice a decline in their power production and efficiency and they'll become less effective at converting the sun's energy into power. This is known as the solar panel degradation rate. On average, solar panels degrade at a rate of around 0.5% per year.

Can solar panels break?

The materials and components including the solar glass, aluminum frame, and solar cells used in the panel can break if they are of low quality. Some manufacturers reduce the amount of aluminum they use in the frame to keep prices down, and thinner frames are more vulnerable to damage.

How much do solar panels deteriorate a year?

Appropriate degradation rates of solar panels are estimated at 0.5% per year considering a well-maintained PV system featuring ideal conditions. However, solar panel degradation rates can reach up in some extreme cases, going as high as 1.4% or 1.54% per year.

What is solar panel degradation?

Solar panel degradation comprises a series of mechanisms through which a PV module degrades and reduces its efficiency year after year. Aging is the main factor affecting solar panel degradation, this can cause corrosion, and delamination, also affecting the properties of PV materials.

How often does solar panel degradation occur?

While PV technology has been present since the 1970s, solar panel degradation has been studied mainly in the last 25 years. Research Institutes like NREL have estimated that appropriate degradation rates of solar panels can be set at 0.5% per year with current technology. What is the impact of solar panel degradation on your PV system?
