

# The current status of microgrid development in the United States

## Overview

---

Why are microgrids becoming more popular in the United States?

Microgrids have become increasingly popular in the United States. About 34% of the world's microgrid projects are located in the United States and North America area - drivers for this fast growth could include the country's aging electricity megagrid and end-use customers' increasing desire for greater security and reliability .

Does the US have a role in developing remote microgrids?

The United States Agency for International Development has also taken advantage of DOE-developed expertise in their remote microgrid work in Africa<sup>1</sup>, Haiti<sup>2</sup>, and other rural and remote communities, which has provided valuable insight on technical, regulatory, and procedural rollout of microgrids in the United States.

Does the US have a microgrid system?

More recently, the U.S. DOE has focused on issues related to microgrid systems integration [ 45 ]. During the period from 2010 to 2017, microgrid capacity in the United States nearly tripled, increasing from roughly 700 MW to 2000 MW [ 11 ].

How does government support microgrids?

Support for microgrids comes from research and development (R&D) programs at federal and state levels, software and tools, grants and funding support to incentivize demonstration projects, and tax and financial incentives for the installation of distributed energy , , , .

Where does microgrid development take place?

While the federal programs described above were the main engine of early U.S. microgrid research and development, there has always been significant activity at the state and local levels—often arising from self-generation

projects, typically at large commercial, campus, medical, or industrial sites.

What drives microgrid development?

The driving forces in microgrid development at the state and local levels include renewable energy requirements as reflected in renewable portfolio standards (RPS) in 29 states and Washington, DC; renewable portfolio goals in eight states; and increasing concerns regarding power system resilience due to growing extreme climate events [38, 39, 40].
