

The mountains are covered with photovoltaic panels

Overview

Should solar panels be installed on snow-covered mountains?

The placement of solar panels on snow-covered mountains can boost the production of electricity when it is most needed — in the cold, dark winter. Solar-power systems have long been hampered by a seasonal problem: the panels produce more energy in summer than in winter, at least in the mid-latitudes, where much of the planet's population lives.

Where are large-scale photovoltaic solar panels installed?

Large-scale photovoltaic solar panels have been installed on the Taihang Mountains in Shexian county, North China's Hebei province, to make use of large mountainous areas and to promote clean energy. The installed capacity of the photovoltaic systems, which convert light into electricity, is expected to reach 321 megawatts annually.

What are solar panels made of?

The installation consists of 2,240 square metres of solar panels, arranged in five rows of eight over all but one of the 36 floats. "The floats are made of polyethylene and the frame supporting the solar panels is aluminium," explains Fuchs. "The solar panels are two-sided and made of glass."

What are the benefits of higher altitudes for solar panels?

Overall, in higher altitudes, stronger solar irradiation and lower temperatures pose significant advantages. The clean air in this area means less dust and fog

- a big plus for keeping the solar panels cleaner for a more extended period. Dust-free mountain air keeps the panels cleaner for a more extended period.

Why do solar panels work in Switzerland?

High up in the Swiss mountains, the atmosphere is rarer, solar radiation stronger, and in winter the snow can reflect the sunlight. Romande Energie is the company behind the project. According to the founders, the unique alpine conditions are what allow the solar panels to act so efficiently.
