

# The photovoltaic inverter power light is flashing

## Overview

---

Look for the green LED: when it is on, the system is producing power, if it is flashing, this means the inverter has AC power and is in Standby mode. Why does my solar inverter keep flashing?

If not, the green light keeps flashing until solar radiation becomes strong enough to start-up the solar inverter. Yellow Light - The yellow 'Fault' LED indicates that the solar inverter has detected a fault condition. A fault description will appear on the display.

What does a green light on a solar inverter mean?

Green Light - The green 'Power' LED indicates that the solar inverter is operating correctly. The green light flashes upon start-up, during the grid check routine. If a correct grid voltage is detected and solar radiation is strong enough to start-up the unit, the green light stays on steady.

Why is my inverter flashing green?

If the green LED is flashing, the inverter is in its initializing phase which is a normal operating state as well. All other signals indicate a disturbed operating state. Refer to the inverter manual for more information on the different LED signal codes. 1 - Power, Green in colour. Normal Operation Mode.

How do I know if my solar inverter has a fault?

A fault description will appear on the display. Red Light - The red 'GFI' LED indicates that the solar inverter is detecting a ground fault on the DC side of the photovoltaic system. When this kind of fault is detected, the solar inverter disconnects from the grid and the corresponding fault indication appears on the LCD display.

What does a flashing light mean on a PV system?

The opposite slow flashing means your battery is losing power. Load Icon: This is the load you put on your PV system. This icon lets you know if it's big, small,

or perfect. Depending on the Charge Controller, Light Blinking here means Overloading and Short-circuit.

Why is my solar inverter NOT working?

The problem may be on the DC input or inside the inverter. To check for the DC input, use a multi-meter to measure the DC input voltage from the battery or the solar panels. The battery may be discharged too deeply and is damaged, or the sunlight intensity is too low. The components inside the inverter may be damaged.
