

The relationship between antimony ore and photovoltaic energy storage

Overview

Is antimony the future of energy storage and photovoltaic technology?

The demand for antimony in photovoltaic and energy storage fields will increase significantly with clean energy technology development. The explosive development of solar photovoltaic (PV) and energy storage systems (ESSs) in recent years endows the antimony (Sb) with a new role in the renewable era (Li et al., 2021; Simpson et al., 2021).

Is antimony a critical metal for the energy transition?

Energy Res., 26 September 2022 Antimony is a type of critical metal for the energy transition. The antimony industry chain is distributed among the major developed and developing countries around the world. With the development of clean energy technology, the demand for antimony in photovoltaic and energy storage fields will increase significantly.

How does international competitive relations affect the antimony industry chain?

International competitive relations of countries have caused a high supply risk of products related to the antimony industry chain. The supply risk of the antimony industry chain shows that countries must strengthen industrial division and cooperation to maximize their interests.

Are antimony ores a problem?

Nevertheless, the global supply of antimony ores faces problems of severe shortage and highly concentrated mining from a mid-to-long-term perspective (Henckens et al., 2014; Patiño Douce, 2016). Most countries must obtain antimony ores through international trade for the uneven geographical distribution of antimony ores.

How risky is the antimony industry in Australia?

For Australia, Canada, and the United States, the whole antimony industry

chain is relatively complete, but the supply risk of AO, AOX, and FR is relatively high. FIGURE 4. Import structures and risks of key commodities in the antimony industry chain in Australia, Canada, and the United States.

Does recycling increase antimony supply?

We found that the antimony diversity of supply of both mining and refining is low, but is enhanced by recycling, around 25% of global antimony supply is produced via recycling of antimony bearing metal alloys. Based on production volume, almost 70% of antimony was mined as by- or co-product in 2018, indicating a high supply risk.
