

# The voltage of the transformer corresponding to the photovoltaic panel

## Overview

---

The PV module is able to produce a voltage as high as 1100V (DC). The resulting DC voltage is transformed into three-phase AC voltage by using a three-phase inverter. How a transformer is used in a PV inverter?

To step up the output voltage of the inverter to such levels, a transformer is employed at its output. This facilitates further interconnections within the PV system before supplying power to the grid. The paper sets out various parameters associated with such transformers and the key performance indicators to be considered.

Should a transformer be rated near a PV plant peak power?

In fact, while selecting a transformer rated power close to the PV plant peak power makes theoretically possible to fully transfer the captured solar energy to the utility network, such a design criterion will in practice lead to oversize both the transformer, the inverter and the power line.

What is a solar inverter transformer?

The inverter transformer, which is used primarily as a step-up transformer, changes the input voltage and accommodates the voltage polarity reversal and pulsation taking place in the power inverting process. This prepares the solar electricity for introduction into the electricity grid.

What voltage does a renewable transformer use?

Renewable transformers also have different voltages than the standard industrial voltages you might have seen. 800, 630, and 600 are all common voltages used with solar arrays. 800V is more common with European inverter manufacturers; 630V is usually found in larger solar arrays; and 600V is the most common voltage for solar inverters.

Why is sizing a transformer important for a PV power plant?

Transformers need to with-stand high temperatures as harsh weather conditions.

Sizing of these transformers is a crucial factor when planning a PV power plant, as too large rated power can lead to instabilities and economic disadvantages as well as too small trans-fo.

How does a centralized inverter work in a PV plant?

As shown in Fig. 1, in a traditional PV plant a large number of PV modules are series connected in long strings and a single centralized inverter provides the voltage inversion. Step-up transformers are required to boost the 480÷690 V inverters output voltage to the 13.8÷46 kV of the medium voltage utility network .
