

# **The wind temperature required for hot wind power generation**

## Overview

---

How does wind power affect the atmosphere?

The climatic impacts of wind power may be unexpected, as wind turbines only re-distribute heat within the atmosphere, and the  $1.0 \text{ W m}^{-2}$  of heating resulting from kinetic energy dissipation in the lower atmosphere is only about 0.6% of the diurnally averaged radiative flux.

How can climate modelling improve wind energy production?

The evolution of climate modelling to increasingly address mesoscale processes is providing improved projections of both wind resources and wind turbine operating conditions, and will contribute to continued reductions in the levelized cost of energy from wind power generation.

Does wind power affect climate?

In agreement with observations and prior model-based analyses, US wind power will likely cause non-negligible climate impacts. While these impacts differ from the climate impacts of GHGs in many important respects, they should not be neglected. Wind's climate impacts are large compared with solar PVs.

How to plan a wind project in a hot environment?

Planning wind project in a hot environment requires temperature data at hub height. Weibull parameters changes significantly during high temperature conditions. Accurately estimating wind turbines' annual energy production (AEP) is a paramount for planning and performance assessment of wind power projects.

Can a wind turbine generate electricity from a high wind speed?

In this way, the turbine is capable of generating electricity from high wind speeds. During high wind speed, turbulence can occur due to the turbine tower; therefore, the rotor is placed in front of the tower. The blades of wind

turbines are also made rigid to withstand the load caused by high winds .

Why should a wind turbine be higher than 10 m?

Furthermore, increasing the height of the tower will enable the turbine to receive high wind speed. Moreover, wind speed and power can increase by 20% and 30%, respectively, with increasing the tower height of 10 m. Under extreme wind conditions, the wind turbine rotates extremely fast, which can damage the turbine [76, 77].
