

# Ups plane crash lithium battery

On September 3, 2010, UPS Airlines Flight 6, the Boeing 747-400F flying the route between Dubai, United Arab Emirates, and Cologne, Germany, developed an in-flight fire, which caused the aircraft to crash, killing both crew members, the only people on board. It was the first fatal air crash for UPS Airlines.

Why did a UPS Boeing 747 crash in 2010?

2010 mishap traced to cargo hold fire. that crashed in 2010. (Photo credit: EPA)\*\* Accident investigators have traced a fire that destroyed a UPS Boeing 747 in the United Arab Emirates in 2010 to the lithium batteries being carried in the cargo hold.

What caused the 2010 UPS plane fire?

The 2010 UPS plane fire was caused by lithium batteries in the cargo. Crash investigators in the United Arab Emirates found that smoke-detection equipment took too long to alert the crew, according to a report released Wednesday.

Can lithium batteries cause a fatal aircraft accident?

As a result, there hasn't been a fatal aircraft accident caused by lithium batteries since Asiana Airlines flight 991 in 2011. This triumph of safety didn't come from nowhere. It was enabled by dedicated experts, difficult scientific research, robust institutions, and safety-minded industry cultures.

Was a lithium battery found on Flight 6?

A lithium battery pack, probably for a laptop, that was loaded on flight 6, shown as it was found after the crash. (GCAA) At 18:51 local time, as dusk fell over the United Arab Emirates, flight 6 departed Dubai and began to climb over the Persian Gulf, heading for its cruise altitude of 32,000 feet.

Could lithium batteries cause a Boeing 747 fire?

(Photo credit: EPA)\*\* Accident investigators have traced a fire that destroyed a UPS Boeing 747 in the United Arab Emirates in 2010 to the lithium batteries being carried in the cargo hold. Unless something is done to prevent similar disasters, the FAA now says such crashes are all but inevitable in the future.
