## Overview

What are new materials for solar photovoltaic devices?

This review discusses the latest advancements in the field of novel materials for solar photovoltaic devices, including emerging technologies such as perovskite solar cells. It evaluates the efficiency and durability of different generations of materials in solar photovoltaic devices and compares them with traditional materials.

What materials are used in PV modules?

While low iron float glass is the most common material used in PV modules, it is heavy, requires tempering for safety, and sometimes presents adhesion problems that can lead to de-lamination. Frontsheets also typically include anti-reflective and anti-soiling coatings.

Are new materials a technology risk for the photovoltaic cell and module industry?

This presents a technology risk for the industry. This report provides a global survey from IEA PVPS member countries of efforts being made to design new materials for photovoltaic cell and module applications.

What materials are used for PV module frontsheets?

The most common material used for PV module frontsheets is low iron (<120 ppm Fe) float glass. Functional coatings are added to the surfaces of the glass to increase light adsorption (anti-reflective coatings) and/or to reduce the accumulation of dirt and debris on the module in the field (anti-soiling coatings).

What are the different types of photovoltaic (PV) applications?

There are many Photovoltaic (PV) applications, including Building Integrated Photovoltaics (BIPV), buildings with weight limitations, buildings with curved roof surfaces, or other outdoor portable applications, where flexible or

conformable PV products would be beneficial.

What is a crystalline silicon PV module made of?

Both crystalline silicon PV modules and most thin film modules are manufactured with a front cover made from tempered soda lime silicate glass - the same material used in buildings as window glass.
