How do solar cells generate electricity?

PV cells, or solar cells, generate electricity by absorbing sunlight and using the light energy to create an electrical current. The process of how PV cells work can be broken down into three basic steps: first, a PV cell absorbs light and knocks electrons loose. Then, an electric current is created by the loose-flowing electrons.

How do photovoltaic cells work?

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can

convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

What type of electricity does a PV cell generate?

PV cells generate direct current (DC) electricity. DC electricity can be used to charge batteries that power devices that use DC electricity. Nearly all electricity is supplied as alternating current (AC) in electricity transmission and distribution systems.

Can solar cells convert artificial light into electricity?

Some PV cells can convert artificial light into electricity. Large banks of solar cells maximise the amount of solar energy they can generate. Solar Photovoltaic (PV) cells generate electricity by absorbing sunlight and using that light energy to create an electrical current.
