

# What is the current maximum efficiency of photovoltaic panels

## Overview

---

The highest efficiency of solar panels can reach almost 23 percent efficiency, which is impressive considering the first solar modules were only 6% efficient. What is solar panel efficiency?

Solar panel efficiency is the amount of sunlight (solar irradiance) that falls on the surface of a solar panel and is converted into electricity. Due to the many advances in photovoltaic technology over recent years, the average panel conversion efficiency has increased from 15% to over 23%.

Which solar panels are most efficient?

The solar cell type, design and configuration all have an impact on panel efficiency with the N-Type back-contact (IBC) cells being the most efficient. SunPower Maxeon panels are still in the top spot with the new Maxeon 7 series, which is currently in limited release.

How efficient are photovoltaic panels?

Due to the many advances in photovoltaic technology over recent years, the average panel conversion efficiency has increased from 15% to over 23%. This significant jump in efficiency resulted in the power rating of a standard-size panel increasing from 250W to over 450W.

How efficient are solar panels in 2024?

In 2024, the average efficiency is about 21.4%, which translates to 10% more electricity produced per panel. Within those averages, you'll find solar panels with a range of efficiency ratings. It might not surprise you that you'll usually pay more for solar panels with greater efficiency.

How much energy does a solar panel use?

It depends on the solar panel. The most efficient solar panel on our list tops 24%, meaning they convert more than 24% of the available energy from sunlight into usable electricity. Not all solar panels hit that figure, and the

ones you buy might fall below it.

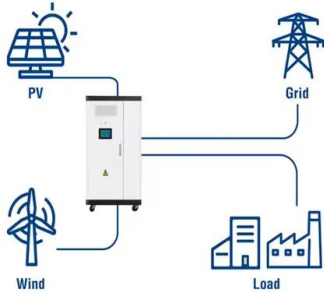

Is a more efficient solar panel a better option?

Higher efficiency does not automatically imply that a more efficient panel is the best option for a certain commercial solar installation. The optimum panel power, size, and efficiency for a particular project are determined by the site or building area, the mounting system, wind loading, and other site-specific requirements.

$I_{sc}$  is the short-circuit current; FF is the fill factor and  $\eta$  is the efficiency. The input power for efficiency calculations is  $1 \text{ kW/m}^2$  or  $100 \text{ mW/cm}^2$ . Thus the input power for a  $100 \times 100 \text{ mm}^2$  cell is  $10 \text{ W}$  and for a  $156 \times 156 \text{ mm}^2$  cell is  $24.3 \text{ W}$
