

What is the customer base of microgrids

Overview

Around the world, 770 million people lack access to electricity. More importantly, 3.5 billion people are without reliable electricity, creating barriers to education, the internet, and other forms of economic development. The vast majority of these people live in rural communities, where building expansive energy grids is too.

Unlike traditional power plants, microgrids are located closer to their end users, adding electricity to the grid without adding the cost (and time) that would have been needed to build.

For most electricity customers, the peace-of-mind that microgrids provide can be expensive. FERC Order 2222 allows microgrid owners to sell.

A decentralized grid is also better able to withstand natural disasters. In the Australian outback, where bushfires destroyed 20% of the nation's forests, rural communities have turned.

Grid operators and lawmakers are increasingly concerned about cyberattacks on their electricity system—a new form of cyberwarfare. A more decentralized electricity network built.
