

# **What is the voltage range of high temperature photovoltaic panels**

## Overview

---

Most of us would assume that stronger and hotter the sun is, the more electricity our solar panels will produce. But that's not the case. One of the key factors affecting the amount of power we get from a solar system is the temperature. Although the temperature doesn't affect the amount of sunlight a solar cell receives.

If you have photovoltaic solar panels installed at home or plan to get some in the near future, it's useful to have a good understanding about the difference between the energy of electrons at a low energy state and electrons.

The maximum temperature solar panels can reach depends on a combination of factors such as solar irradiance, outside air temperature, position.

You may have heard people doubting solar panel performance in cold weather. Some may even think that solar panels stop working when it's.

Being aware of the effect higher temperature has on the energy output, most certified installers take steps to support natural cooling of solar systems. A good practice for maximum efficiency is leaving at least a six-inch.
