

# **What level should I use for photovoltaic panel installation**

## Overview

---

Successful solar installs ideally require a roof pitch between 20° and 45°, with roofs outside these pitch parameters affecting the efficiency of the panels. What angle should solar panels be installed on a roof?

Anywhere between 20 and 50 degrees will usually enable your system to produce roughly as much electricity as it could. And in the case of most rooftop solar panel installations, the angle of the solar panels is determined by the angle of the roof - so there isn't much you can do to change it.

What angle should solar panels be installed in London?

For instance, the latitude of London is 51.5 degrees, but the optimum angle for solar panels in this city is 36 degrees. However, in the case of most rooftop solar panel installations, the angle of the solar panels is determined by the angle of the roof - there isn't much you can do to change it.

How many solar panels can be installed on a roof?

Your roof will need to be large enough to fit a suitable number of solar panels, as there's rarely much point putting just two or three panels up there. The average solar panel takes up 2m<sup>2</sup>, and your installer should leave around 40cm on each side of the array, as well as 3cm between every panel.

What angle should solar panels be installed in a garden?

When it comes to solar installation in your garden, the best angle and orientation are very similar to rooftop installation - ranging from about 30 to 40°. Since solar panels in gardens are often ground-mounted, they can be adjusted to different tilt angles easily.

Which direction should solar panels be installed?

" Solar PV (photovoltaic) panels generate electricity from sunlight and will normally be installed on the roof of the building facing in the most south direction. The panels should also face as much south as possible. If you faced

east, or west, then expect a yield of around 20% less generation annually" explains David Hilton.

How high should solar panels be on a flat roof?

On a flat roof, the highest part of the solar PV equipment should not be more than 600mm higher than the highest part of the roof (excluding chimney). In some cases, however, permitted development rights are more limited.
