Photovoltaics are best known as a method for generating electric power by using solar cells to convert energy from the sun into a flow of electrons by the photovoltaic effect. Solar cells produce direct current electricity from sunlight which can be used to power equipment or to recharge batteries. The first practical.

Photovoltaics (PV) is the conversion of into using that exhibit the , a phenomenon studied in , , and . The photovoltaic effect is.

Module performance is generally rated under standard test conditions (STC): of 1,000 , solar of 1.5.

There have been major changes in the underlying costs, industry structure and market prices of solar photovoltaics technology, over the years.

The term "photovoltaic" comes from the φῶς (phōs) meaning "light", and from "volt", the unit of electromotive force, the .

In 1989, the German Research Ministry initiated the first ever program to finance PV roofs (2200 roofs). A program led by Walter Sandtner in Bonn, Germany. In 1994, Japan followed in.

Overall the manufacturing process of creating solar photovoltaics is simple in that it does not require the culmination of many complex or moving.

Solar photovoltaics formed the largest body of research among the seven sustainable energy types examined in a global .

A solar cell or photovoltaic cell (PV cell) is an electronic device that converts the energy of directly into by means of the . It is a form of photoelectric cell, a device whose electrical characteristics (such as , , or ) vary when it is exposed to light. Individual solar cell devices are often the electrical building blocks of , kn.

The term is derived from two root words: 'photo' and 'volt'. The former comes from the Greek word for 'light', as in photosynthesis. The latter is the unit of electromotive force, one of the measurements for electric power. What is a

solar cell & a photovoltaic cell?

A solar cell or photovoltaic cell (PV cell) is an electronic device that converts the energy of light directly into electricity by means of the photovoltaic effect. [ 1 ] It is a form of photoelectric cell, a device whose electrical characteristics (such as current, voltage, or resistance) vary when it is exposed to light.

Where does the word photovoltaic come from?

The term "photovoltaic" comes from the Greek  $\phi\omega\varsigma$  (phōs) meaning "light", and from "volt", the unit of electromotive force, the volt, which in turn comes from the last name of the Italian physicist Alessandro Volta, inventor of the battery (electrochemical cell). The term "photovoltaic" has been in use in English since 1849.

What does photovoltaic mean?

The latter is the unit of electromotive force, one of the measurements for electric power. 'Photovoltaic' can mean either the ability to produce electricity from light, or related to the process of doing so. Photovoltaic or PV in short is used to describe the process of converting light (photons) to electricity (voltage).

What does PV mean in physics?

In physics, the term "photovoltaic" (PV) comes from two root words: "photo" (light) and "voltaic" (voltage). It refers to anything that produces electricity when exposed to light or other radiant energy.

What is the photovoltaic process?

The photovoltaic process bears certain similarities to photosynthesis, the process by which the energy in light is converted into chemical energy in plants. Since solar cells obviously cannot produce electric power in the dark, part of the energy they develop under light is stored, in many applications, for use when light is not available.

What are the different types of photovoltaic technology?

Modern photovoltaic technology has more and more options being created each year. For example, amorphous silicon, gallium arsenide, metal chalcogenides, organometallics, perovskite and mesoscopic solar cells. Silicon solar cells are the initial prototypes. The newer version is the thin-film PV cell.
